Re: Ex Parte Presentation (IB Docket No. 95-91; WT Docket No. 07-293)

Dear Ms. Dortch:

On December 1, 2008, representatives of Sirius XM Radio, Inc. ("Sirius XM") discussed issues associated with the above-captioned proceedings with Bruce Gottlieb, Legal Advisor to Commissioner Copps.

Sirius XM participants were Terry Smith and James Blitz, who were joined by Michael Lewis (Engineering Consultant) and the undersigned from Wiley Rein, LLP on behalf of the company.

Repeating its previously filed recommendations relating to the establishment of permanent licensing rules for satellite radio terrestrial repeaters and modification of technical services rules for the Wireless Communications Service ("WCS"), Sirius XM urged the Commission to finalize the repeater rules and take no action on the WCS rules that would disrupt satellite service to more than 19 million consumers. Sirius XM argued that this is best accomplished by maintaining the existing technical requirements for the WCS C and D spectrum blocks and relaxing the existing out-of-band emissions mask to 90+10logP for mobile devices operating on the WCS A and B blocks.

Sirius XM distributed the attached presentation, which should be inserted into the record.

Sincerely,

/s/ Robert L. Pettit

Robert L. Pettit
Counsel to Sirius XM Radio, Inc.

cc: Bruce Gottlieb

Satellite Radio/WCS Interference Issues

Executive Summary

- Sirius XM needs a formalized licensing process for its terrestrial repeaters. The process should provide blanket authorization for new transmitters while grandfathering existing repeaters.
- The FCC must protect the ability of 19 million subscribers to receive high quality service from Sirius XM without interruption from WCS mobile devices. This requires that WCS wide area mobile services be confined to the WCS A and B blocks under realistic technical standards (maximum output power of 125 milliwatts; out-of-band emissions limits of $90+10\log P$ into the satellite radio allocation).

Satellite Radio And WCS

There Are Two Separate Proceedings

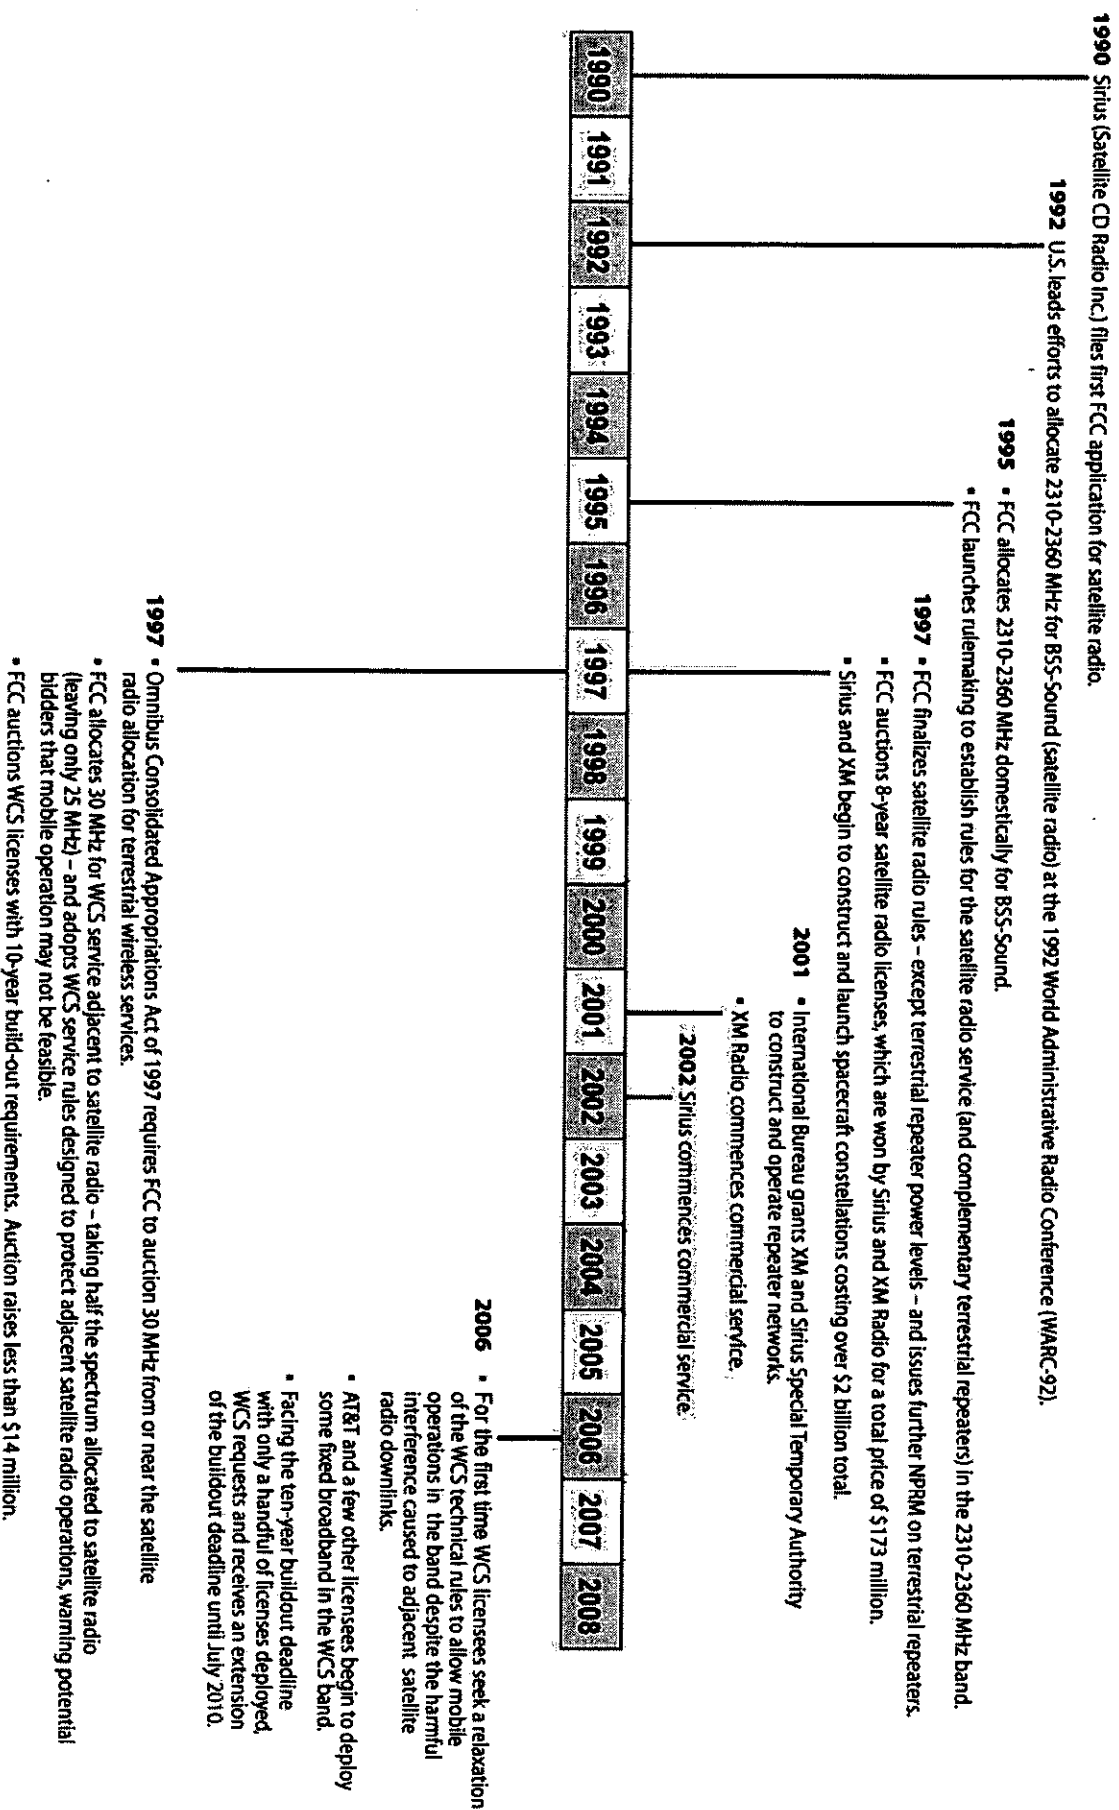

Satellite Radio Repeater Rules (IB Dkt. No. 95-91) – Part 25

- Initiated in 1997, the current focus is the establishment of permanent licensing rules for satellite radio terrestrial repeaters.
- Currently, terrestrial repeaters are authorized through a cumbersome STA process.
- There are few points of controversy in this proceeding and issues are sufficiently narrow to adopt rules now.

Amendment of WCS Rules (WC Dkt. No. 07-293) – Part 27

- Initiated in December 2007, this proceeding proposes to significantly expand opportunities for mobile WCS uses.
- WCS licensees seek technical rule changes to allow incompatible mobile use on frequencies immediately adjacent to satellite radio spectrum now used to serve 19 million consumers as well as critical flight testing operations for both military and civilian aircraft.

Timeline of Satellite Radio and WCS Proceedings

The Fundamental Issue

WCS licensees are seeking to undo FCC decisions made in 1997 to protect satellite radio and aircraft testing operations from mobile WCS transmitters. Placing unaffiliated mobile services immediately adjacent to satellite receive bands would be unprecedented.

The Rules Must Reflect the Environment in Which Satellite Radio Operates

The Rules Must Reflect the Environment in Which Satellite Radio Operates

In developing technical rules for WCS, the
FCC must consider:

- 1) the proximity of the WCS service to satellite
radio,
- 2) the challenging service conditions for satellite
radio, and
- 3) the risk that millions of existing satellite radio
subscribers will receive harmful interference that
will mute their reception.

Point 1: WCS and Satellite Radio Operate on Adjacent Frequencies

- The satellite radio allocation falls between two WCS spectrum blocks.
- WCS C & D Blocks are immediately adjacent to satellite downlink spectrum.
- WCS spectrum is also immediately adjacent to flight telemetry and nearby to radio astronomy allocations.

Point 2: Satellite Radio Faces Challenging Service Conditions

- To remain competitive, satellite radio must deliver a reliable and high-quality product.
- Providing high-quality audio from a satellite to a vehicular receiver requires signal diversity from two satellites and, in dense urban areas, additional diversity from terrestrial repeaters.
- Located tens of thousands of miles away, satellites provide a relatively weak signal on the ground that is subjected to further attenuation from typical operating conditions (buildings, overpasses, foliage).
- The satellite radio “link margin” (the amount of additional power available to overcome shadowing or blockage) is minimal, especially in comparison to the level of potential WCS interference.
- In large part, satellite radio infrastructure was designed and constructed in reliance of FCC rules that protect satellite receivers from mobile WCS devices. Changing the rules now threatens the continued delivery of high quality audio to more than 19 million subscribers.

Point 2: Satellite Radio Faces Challenging Service Conditions (cont.)

- Because of the difficult service conditions, the FCC in 1997 protected satellite radio listeners from excessive interference by adopting rules that restrict widespread and incompatible mobile services in the WCS bands.
- The Commission noted that if satellite radio “in this spectrum is subject to excessive interference, the service will not be successful and the American public will not benefit.”^[1]
- The FCC understood that the restrictions on WCS emissions likely made “mobile operations in the WCS spectrum technologically infeasible” and later noted that “wide area, full mobility systems and services” were “likely to be of questionable feasibility.”^[2]
- Before it auctioned the WCS spectrum, the FCC went out of its way to “caution prospective WCS licensees . . . to carefully consider whether their anticipated uses and business plans can be successfully implemented under the additional technical and operational restrictions necessary to qualify for the lesser out-of-band emission limit.”^[3]
- The Commission adopted technology neutral WCS rules because it was “unable to determine the specific operating parameters of a WCS service until the service is actually implemented” and therefore concluded that it was “appropriate to adopt limits that take into account any possible system configuration.”^[4]

^[1] Amendment of the Commission's Rules to Establish Part 27, the Wireless Communications Service, Memorandum Opinion and Order, 12 FCC Rcd 3977, 3992 (¶ 27) (1997) (“WCS MO&O”).

^[2] See *Id.*, 12 FCC Rcd at 3979 (¶ 5); Amendment of the Commission's Rules to Establish Part 27, the Wireless Communications Service, Report and Order, 12 FCC Rcd 10785, 10787 (¶ 3) (1997).

^[3] WCS MO&O, 12 FCC Rcd at 3979 (¶ 5).

^[4] *Id.* at 3997 (¶ 25).

Point 2: Satellite Radio Faces Challenging Service Conditions (cont.)

- The FCC's warnings about the impracticality of mobile service allowed WCS licenses to be acquired at bargain basement prices. The WCS auctions raised a total \$13.6 million for 30 MHz nationwide.
- Any change now would constitute unjust enrichment for current licensees and reward them for warehousing spectrum for more than a decade.
- Should the FCC consider adopting new WCS rules that substantially modifies the permissible services from that envisioned in 1997, the FCC should hold new auctions for WCS licenses.

Point 3: Satellite Radio Currently Serves Millions of Consumers

Satellite radio is an FCC success story. There are 19 million consumers who use receivers that were designed and manufactured under technical rules that did not envision incompatible, wide-area mobile service in adjacent bands.

Satellite Radio - An FCC Success Story

The WCS Proposal Will Cause Harmful Interference to Satellite Radio Consumers

The WCS Coalition's proposal would increase interference to satellite radio in two ways.

OOBE Interference

- Excessively high levels of WCS out-of-band emissions (OOBE) will mute satellite radio reception.
- This form of interference must be addressed at the transmitter – receivers cannot filter OOBE without damaging the desired signal as well.

Overload Interference

- Excessive WCS mobile power will mute satellite radios when the two devices are in proximity. The ability of Sirius XM receivers to "block" overload interference is on par with comparable terrestrial services, but there is a limit to what filtering can do given the relatively weak satellite signals and the potentially strong WCS interfering signals.

The WCS Proposal Will Cause Harmful Interference to Satellite Radio Consumers

- In 2007, the WCS Coalition requested an unprecedented relaxation of the out-of-band emission limits for WCS mobile devices.
- The proposal represents an increase in permissible out-of-band emissions by a factor of 316,000 (55 dB) over the 1997 rules established to protect satellite radio consumers.
- The effect would be the establishment of incompatible mobile services in the WCS bands – something the Commission said was not feasible in 1997.
- *Nothing has changed the physics to support such wholesale changes to the rules that would work against adjacent services that were built in compliance and reliance with the existing rules.*

The WCS Proposal Will Mute Satellite Radio Reception

High Probability of Interference

In many driving environments such as congested highways, there is a high probability of consumers listening to satellite radio being muted by multiple WCS mobile units.

High Probability of Interference (cont.)

Congested or nearby traffic is typical.

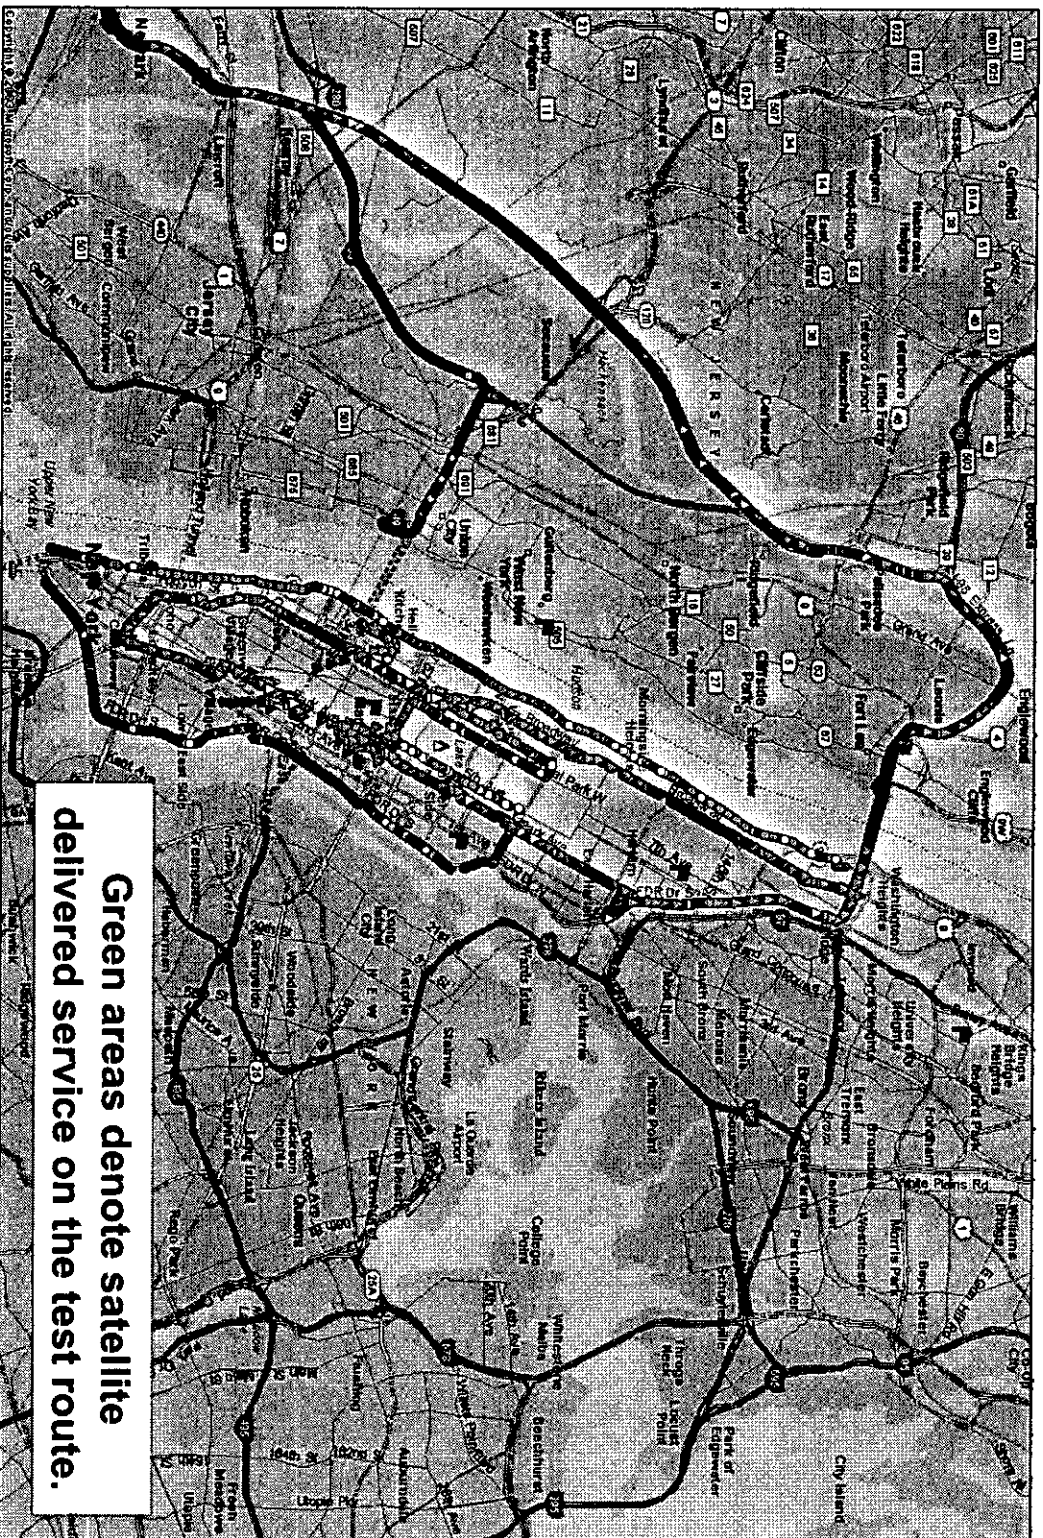

The WCS Proposal Will Cause Harmful Interference to Satellite Radio Consumers

- **Satellite radio and WCS interests have submitted interference field test results:**
 - Unlike the tests submitted by WCS, Sirius XM's tests are detailed, transparent and replicable.
 - Joint testing - paid for by the parties and conducted by an independent lab with FCC oversight – would confirm Sirius XM's results.
 - Since January 2008, Sirius XM has repeatedly sought WCS participation in joint testing, but WCS has refused to participate.
- **Both satellite radio and WCS have submitted analytical interference probability studies:**
 - The WCS study presumes that mobile WCS services will gain little market share and will be mostly used indoors. This may or may not be the case.
 - The FCC has *never* sanctioned harmful adjacent-band interference on grounds of vague and unprovable probability presumptions.
 - Such an approach also would reverse the FCC's determination to protect satellite radio from WCS despite uncertainty as to how the latter would be deployed.

More Satellite Radio Terrestrial Repeaters Is Not the Answer

More Terrestrial Repeaters Is Not the Answer

- Satellite radio is predominantly a satellite service -- terrestrial repeaters cover less than 1% of the U.S.
- An enormous number of repeaters would be needed to overcome increased interference from WCS without any guarantee of success. The costs to Sirius XM would be extreme.
- This approach would turn satellite radio into a terrestrial service, which is inconsistent with the allocation and has been opposed by terrestrial broadcast interests.
- It is remarkable that WCS interests now argue for Sirius XM to install more repeaters to overcome WCS interference. For years, they fought against the deployment of terrestrial repeaters without basis.

Even in Manhattan, consumers rely on satellite signals.

Mobile WCS Operations Will Interfere with Civilian and Military Flight Telemetry

The WCS Proposal Threatens Flight Telemetry Services

- AFTRCC has indicated that relaxation of the WCS OOBE limits will subject adjacent band flight telemetry service to interference.
 - Flight telemetry service is a safety service and harmful interference could result in loss of life and property.
 - Flight telemetry service is used to test both military and civilian aviation equipment.
- AFTRCC has further observed that relaxation of the WCS OOBE limits into the satellite radio allocation increases the chances that harmful interference to flight telemetry services will occur.
 - Flight telemetry services have benefited from the fact that the FCC has successfully protected satellite radio reception. If that protection is reduced, it is likely that the 2360-2370 MHz flight telemetry band will be subjected to OOBE emissions at high levels.
 - AFTRCC has adequately demonstrated the harmful effects of allowing OOBE at 43+10logP into their bands.

**What's a Reasonable
Compromise?**

What's a Reasonable Compromise?

- The current rules allow fixed broadband deployment in WCS spectrum and fully protect satellite radio consumers. The 1997 rules appropriately recognized the importance of protecting satellite radio consumers from WCS interference. Nothing has changed since then.
- Nonetheless, Sirius XM has proposed rule changes it considers reasonable in an effort to accommodate WCS operations while protecting satellite radio consumers.
- *But even these changes will result in more interference for satellite radio listeners.*

The Sirius XM Proposal

- Modify the WCS technical standards to allow mobile services in the WCS A and B blocks:
 - Handsets should be limited to a maximum of 125 milliwatts with out-of-band emissions limits set at $90 + 10 \log P$. These specifications are consistent with FCC proposals for the PCS H-Block.
 - Future consideration of further flexibility if the two services prove to be more compatible.
- Continue to allow fixed broadband services in the C and D blocks as their immediate adjacency to satellite bands necessitates protection of satellite radio at current levels.
- Allow WCS licensees to increase base station power on a coordinated basis in the case of demonstrable interference from grandfathered terrestrial repeaters.

The Sirius XM Proposal

- The FCC should not relegate any portion of Sirius XM's spectrum – for which it paid \$173 million and invested billions to deploy – as a functional guard band for mobile WCS operations.
- Such a result:
 - could constitute retroactive rulemaking by rendering useless spectrum previously allocated for satellite radio;
 - would violate the auction rules requiring the Commission to alert potential bidders of the characteristics of licenses prior to auction;
 - would represent a breach of the Commission's contractual obligation of good faith and fair dealing; and
 - could undermine future auctions.

The WCS Proposals

- WCS interests' have submitted a "compromise" proposal that would result in massive interference to satellite radio.
 - Sirius XM's tests show that the WCS recommended changes to the existing OOB E and power regulations would not protect satellite radio.
- The WCS proposals rely on parameters that are technology and business plan specific. If the FCC relies on these factors to lessen the potential interference to satellite radio, their use must be incorporated into Part 27 rules.
- WCS must continue to protect adjacent radio-astronomy and aeronautical telemetry bands at a levels higher than that proposed for satellite radio. It is disingenuous and misleading for WCS licensees to suggest that it is not possible to provide at least that same level of protection to satellite radio.

Sirius XM's Proposals Are Consistent with OET's Approach to AWS-3

Sirius XM's Proposals Are Consistent with OET's Approach to AWS-3

- Applying OET's analysis and taking into account the key difference between the AWS interference environment and the satellite radio/WCS interference environment leads to conclusions consistent with the proposals of Sirius XM.
- Directly inserting parameters and data that are appropriate for WCS/satellite radio into the equations contained in the AWS-3 technical report, the OET analysis would yield technical specifications for WCS mobile devices that are far more stringent than that proposed by the WCS Coalition.

**Hundreds of Megahertz of
Spectrum Are Available
for Fixed and Mobile
Broadband Services**

Hundreds of Megahertz of Spectrum Are Available for Fixed and Mobile Broadband Services

- Sirius XM understands the importance of broadband services, but:
 - As the FCC stated, the “2320-2345 MHz frequency band is the only spectrum specifically available” for provision of satellite radio in the United States.^[1]
 - On the other hand, even the WCS licensees recognize that there are hundreds of MHz of spectrum available for fixed and mobile wireless broadband in other bands.^[2]
 - This fact was recognized by the FCC in 1997 when it informed WCS licensees that terrestrial mobile service “can be provided in other spectrum currently available for use by services including cellular and PCS.”^[3]

Car Companies Unanimously Oppose the WCS Proposal

November 21, 2008
Ms. Marlene H. Dwyer
Secretary
Federal Communications Commission
445 Twelfth Street, SW
Washington, DC 20554

Re: Written Ex Parte Presentation in IB Docket No. 95-91 and WT Docket No. 07-293.

Dear Ms. Dwyer:

The FCC's proceeding to modify the technical specifications for the 2.1 GHz Wireless Communications Service ("WCS") is critical to General Motors and the nearly seven million owners of General Motors vehicles equipped with satellite radio. Operating on frequencies immediately adjacent to these vehicles' satellite radio receivers, WCS devices must not be allowed to become a potential source of harmful interference to in-vehicle reception.

Satellite radio programming has proven popular with car buyers; millions of owners having experienced the technology are now subscribers to this important new source of in-vehicle entertainment options.¹ Indeed, subscribers have installed and customers have purchased more than twenty million vehicles with satellite radio receivers. Our customers enjoy the variety of programming as well as the high-quality audio that satellite radio offers.

Customers have routinely stated on feedback surveys that their reason for subscribing is the ubiquitous coverage and superior sound quality of satellite radio. Vehicle purchasers have high expectations with satellite radio services in their motor vehicles.

These high expectations will likely be frustrated if the FCC takes an action that would potentially create harmful interference. The proposed rule in the captioned proceedings could significantly impair sound quality by facilitating in-vehicle WCS devices.

¹ It is important to note that Sirius XM also provides in-vehicle life-saving emergency broadcasting information regardless of whether a vehicle is subscribed. With its satellite-based two-way emergency capability, vehicle owners have unparalleled access to crisis information when traditional terrestrial-based broadcasting may be lost or limited by damage. General Motors believes the Commission should be especially mindful of the impact of potential harmful interference with this capability.

Naturally, this is a rule that was specifically encouraged due to interference concerns when WCS licenses were auctioned by the FCC.

General Motors therefore urges the FCC to be extremely cautious and ensure that satellite radio performance is not degraded by improperly changing the established rules for WCS operation. Since XM Radio has spent billions of dollars developing services that - so the best of our knowledge - are based on the understanding that mobile WCS devices would not be allowed to interfere.

Satellite radio is unique among FCC-licensed radio and implies a different level of protection from that provided to other mobile devices such as, for example, cell phones. We ask that the Commission keep in mind the following facts:

- Satellite radio represents an extremely dense concentration of customers in a narrow frequency band (more than 18 million subscribers in 25 MHz).
- The FCC has explicitly recognized the impact of any interference or signal degradation.
- Satellite radio provides high-quality audio and music where drop-outs and interruptions of the duration and frequency that WCS mobile operation would cause are unacceptable to subscribers, at large part because competing services (disruption audio services typically) provide error-free service.
- Importantly, satellite radio originates from space-based platforms that provide a relatively low-powered signal to receivers (one of thousands of miles away) (thus necessitating receivers more susceptible to equivalent noise (e.g., hand emissions). Because receivers are not available in the vast majority of the country, the satellite signal strength is not being attenuated or increased by terrestrial means.
- Unlike mobile, land-based devices, most satellite radio antennas are located on top of vehicles and are typically shielded from providing them protection from sources of interference).
- Satellite radios do not use spread spectrum technologies which inherently reduce the impact of interference due to noise (thus preventing a signal overload threshold lower than, for example, the typical cell phone).

² Amendment of the Commission's Rules to Establish Part 27, the Wireless Communications Service, Report and Order, FCC 97-36, 12 FCC Rcd 10783, 11 IC, 158 (1997).

We appreciate the Commission's consideration of these concerns and urge the Commission to ensure that the actions taken fully protect GM and the millions of customers who purchase and enjoy satellite radio services.

Respectfully submitted,

Richard M. Lee

Re: Written Ex Parte Presentation in (B) Docket No. 95-91 and W/1 Docket No. 07-293.

Dear Ms. Dortch:

Satellite radio is extremely popular with automobile buyers. Currently, almost 70% of our new vehicles ship with a satellite radio installed, on of Ford's highest option take rates. The number of customers re-subscribing to the service (after the initial 6 month subscription expires) is currently at 46% and steadily increasing. Our customers enjoy the variety of programming as well as the high quality audio that satellite radio offers.

The FCC's proceeding to modify the technical specifications for the 2.1 GHz Wireless Communications Service ("WCS") is important to us and other automakers. Operating at frequencies immediately adjacent to millions of satellite radios, WCS devices are a potential source of interference to in-vehicle reception. Our consumer research indicates that satellite radio reception quality contributes greatly to the overall SDARS customer satisfaction rating. We would like to ask the commission to please consider these factors as part of your decision making process.

Sincerely,

Douglas R. Vandagens
Director Connected Services
Ford Motor Company

MAY 12 2008

EX PARTE OR LATE FILED

FCC Mail Room

November 7, 2008

Ms. Marlene H. Dornick
Secretary
Federal Communications Commission
445 1 14th Street, S.W.
Washington, DC 20554

Re: Written Ex Parte Presentation in JB Docket No. 05-91 and WT Docket
No. 07-293

Dear Ms. Dornick:

Hyundai Motor America understands satellite radio is a most important component of our growing appeal with U.S. buyers. To help make this a reality, we processed the selective standard installation of XM satellite radio starting in 2006 and that subject is also a part of our XM satellite radio service. We also believe that high-receiver rates and the variety of programming and high-quality audio offered by satellite radio.

The FCC's proceeding to modify the technical specifications for the 2.3 GHz Wireless Communications Service ("WCS") is critical to Hyundai and other automakers. Operating on frequencies previously subject to millions of satellite radio, WCS devices are a serious potential source of interference to U.S. vehicle reception. The proposed rule significantly elevates this risk by including mobile WCS devices - a use that was specifically discouraged due to interference concerns when WCS licenses were auctioned by the FCC.

We urge the FCC to be cautious and ensure that satellite radio is not degraded by changing the established rules for WCS operations. Since XM Radio has spent billions of dollars developing networks that are based on the understanding that mobile WCS devices would not interfere. Automakers have installed tens of millions of satellite radios in their vehicles with the same understanding. Unlike cell phones, automobiles are not discarded every year or two - as these satellite radios will remain operational and in circulation for years to come.

Any loosening of the WCS rules must cause interference to satellite radio. This is, of course, one of the FCC's primary statutory obligations, and we expect that the Commission will exercise its role with appropriate technical diligence. Satellite radio is unique among FCC-regulated services and requires different levels of protection from that provided to cell phones. We ask that the Commission keep in mind the following facts:

Hyundai Motor America

Satellite radio represents an extremely dense concentration of customers in a narrow frequency band (over 18 million subscribers in 35 MHz), thus amplifying the impact of any interference or signal degradation.

Unlike cell phone service - where momentary blips or degradation are easily overcome - satellite radio provides high-quality audio and music where drop-outs and interruptions of the station and frequency that WCS mobile operations will cause are neither expected nor tolerated by subscribers. In large part because competing audio services typically provide spot-free service.

Satellite radio originates from space-based platforms that provide a relatively low-powered signal to receivers tens of thousands of miles away (thus necessitating receivers more susceptible to interruption from outside-band emissions). The satellite signal strength can be degraded or obscured by terrestrial means because receivers are unavailable in most areas of the country.

Hyundai satellite radio antennas - like those of other automakers - are located on our roof racks and are thus shielded (thereby providing less interference protection compared with mobile handheld devices).

Unlike cell phones, satellite radios do not use spread spectrum techniques which inherently reduce the impact of interference data packets (thus preserving a signal overhead threshold lower than the typical cell phones).

We urge you to consider these facts before you decide these proceedings are cause that your actions fully protect the 30 million active satellite radio customer base.

Sincerely,

Mazda North American Operations

November 14, 2008

Ms. Marlene H. Dortch
Secretary
Federal Communications Commission
445 Twelfth Street, SW
Washington, DC 20554

Re: Written Ex Parte Presentation in IB Docket No. 95-91 and WT Docket No. 07-293.

Dear Ms. Dortch:

Mazda North American Operations, headquartered in Irvine, Calif, respectfully submits these comments to express concern over the proposed changes to Wireless Communications Service ("WCS") rules. Specifically, the proposed modification has the potential unintended consequence of causing interference with the satellite radio service currently provided to automobile owners.

Satellite radio is extremely popular with automobile buyers. Currently, a large percentage of new vehicles already ship with a satellite radio installed, and that percentage will significantly increase in the coming years. Just one year ago, the satellite radio installation rate was only about 15 percent. It is projected to hit 30 percent for 2008, rising rapidly to 50 percent in 2009. These numbers confirm that customers do indeed enjoy and value the variety of programming as well as the high-quality audio that satellite radio offers.

We understand that the FCC is considering adopting rules for WCS providers that could result in a significant source of interference to satellite radio reception. Operating on frequencies immediately adjacent to millions of satellite radios, WCS devices are a serious potential source of interference to in-vehicle reception. The proposed rule significantly elevates this risk by facilitating mobile WCS devices - a use that was specifically discouraged due to interference concerns when WCS licenses were auctioned by the FCC.

1025 Connecticut Ave., NW, Suite 310 Washington, D.C. 20036
Telephone 202 467 8700

We urge the FCC to be cautious and ensure that satellite radio is not degraded by changing the established rules for WCS operations. Automakers have installed tens of millions of satellite radios in their vehicles. Unlike cell phones, automobiles are not discarded every year or two - these satellite radios will remain operational and in circulation for years to come.

Sincerely,

Barbara Nocera
Director, Government and Public Affairs

FCC Main Room

Ms. Marlene H. Dorich
Secretary
Federal Communications Commission
445 Twelfth Street, S.W.
Washington, DC 20554

Subject: Written Tax Paper Presentation in IB Docket No. 95-91 and W.T. Lockett No. 07-293.

Dear Mrs. Dorth:

Satellite radio is extremely popular with Jaguar luxury car buyers. At the 2010 model year, 100% of new vehicles will ship to the United States with a standard satellite radio installed. Our customers enjoy the variety of programming as well as the high quality audio that satellite radio delivers.

The FCC's proceeding to modify the technical specifications for the 2.3 GHz Wireless Communications Service ("WCS") is critical to us and other stakeholders. Operating in frequencies immediately adjacent to millions of smaller cell, WCS devices are a serious potential source of interference to its cellular reception. The proposed rule significantly elevates this risk by facilitating ignitable WCS devices — a use that was specifically disavowed by the FCC. Interference concerns when WCS licenses were awarded by the FCC.

We urge the FCC to be cautious and ensure that satellite radio is not degraded by changing the established rules for WTS operations. Since XM Radio has spent billions of dollars developing networks that are based on the understanding that mobile WTS devices would not interfere, a nationwide ban on installed bases of millions of satellite radios in their vehicles with data service is a disconcerting. Unlike cell phones, smartphones are not discarded every year or two — these satellite radios will remain operational and in circulation for years to come.

Any loosening of the FCC's rules must not cause interference to satellite radio users, either. This is, of course, one of the FCC's primary statutory obligations, and we expect that the Commission will exercise its role with appropriate technical diligence. Satellite radio is unique among FCC-regulated entities and requires different kinds of protection from that provided to cell phones. We ask that the Commission keep in mind the following facts:

Switching radio represents an extremely dense concentration of customers in a narrow frequency band (only 40 million listeners in 25 MHz, listening over 20 hours per week on average), thus amplifying the impact of any interference or signal degradation.

Unlike cell phone service where momentary hiccups or degradation are easily overcome, stable radio provides high-quality audio and music where drop-outs and interruptions are neither expected nor tolerated by subscribers. In large part because connecting radio services typically provide carrier-free service.

Specific radio originates from specific platform that provide a relatively low-powered signal to receivers (as of thousands of miles away (these occasionally get receivers more susceptible to impairment from radio-band collisions). The specific signal strength can not be augmented or increased by terrestrial means in most cases of the country.

(like mobile handset devices, most satellite radio antennas are located on top of vehicles and are typically unshielded (thus providing less protection from sources of interference).

Unlike cell phones, satellite radios do not use spread spectrum technologies which inherently reduce the impact of interference data packets (thus presenting a signal overhead threshold lower than the typical cell phones).

Taking into account these differences – and others – distinguishing satellite radio from the FCC's recent analysis on the interference potential between Advanced Wireless Services ("AWS") devices, the result in the AWS proceeding does not support the Part 27 rule changes imposed by the WCS Condition.

Again, we urge you to consider these facts before you decide these priceings and ensure that the actions you take fully protect the millions of consumers who rely on satellite radio.

The FCC Should Resolve the Satellite Radio Repeater Rulemaking Now

The FCC Should Resolve the Satellite Radio Repeater Rulemaking Now

- Sirius XM has been waiting more than 10 years for permanent repeater rules, and there is no technical basis or other reason for further delay.
- Sirius XM has shown that the interference potential from satellite radio repeaters to WCS base stations is minimal and can be largely eliminated with proper WCS site planning and easily implemented interference mitigation techniques.
- WCS base stations enjoy at least a 4 MHz guard band from terrestrial repeater transmissions because terrestrial repeaters operate at least 4 MHz from the WCS C-Block band edge – operations in WCS A and B blocks have between 9 and 14 MHz of guard band.

The Commission Should Adopt Sirius XM's Proposals for Terrestrial Repeaters

- Sirius XM has recommended rules for terrestrial repeaters that would improve certainty and clarity regarding their operation for both satellite radio and WCS licensees.
 - Satellite radio repeaters would be subject to an EIRP cap of 12 kW and meet a ground based limit of less than 100 dBμV/m in 95% of a given market. WCS base stations also should be subject to ground based limits or, in the alternative, appropriate restrictions on antenna height, power and downtilt to limit the impact of interfering "hot spots."
 - Terrestrial repeaters would meet an OOB E requirement of $90+10\log(P)$, which is 15 dB more stringent than the current requirement.
- Sirius XM has proposed the adoption of a formal process to address future interference complaints, including an FCC enforcement backstop.
- These rules would eliminate the need to operate under the unwieldy and inefficient STA process.

The Commission Should Adopt Sirius XM's Proposals for Terrestrial Repeaters

- Grandfather existing terrestrial repeaters.
- WCS licensees can engineer their systems around the existing satellite radio terrestrial network. This is common practice for cellular network deployment.
- In limited circumstances, allow Sirius XM to substitute new repeaters for grandfathered sites at the same operating parameters.
 - allows for replication of grandfathered sites that become unavailable;
 - allows for consolidation/co-location of nearby Sirius and XM grandfathered sites, which would benefit both Sirius XM and WCS licensees.
